Recorded run: October 31, 2026

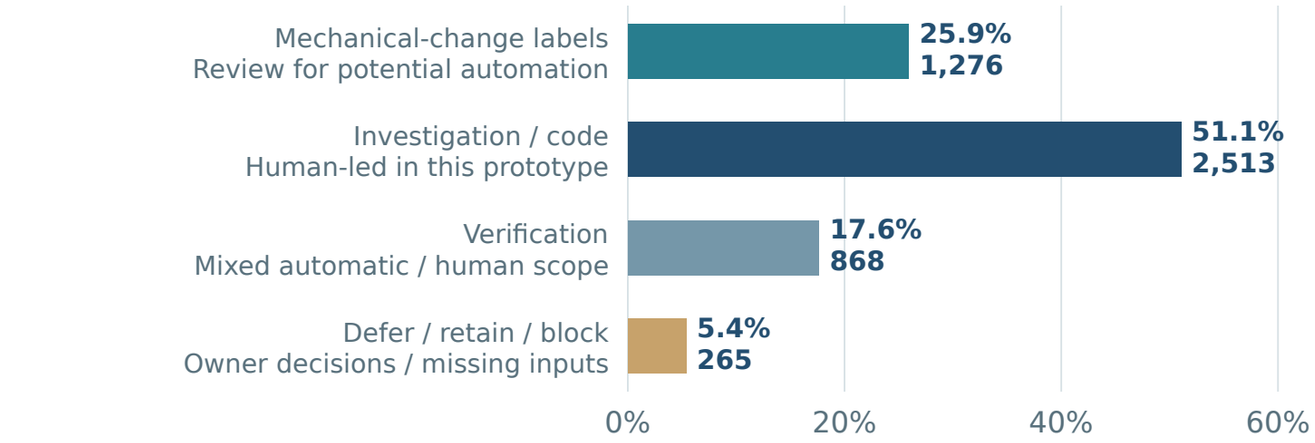
Current proof and candidates for review

Automatic execution from model suggestions: 0 of 418 eligible

Percentages below describe unreviewed text categories. A validated can / cannot automation split is unknown.

Review buckets · 4,922 proposed excerpts

These are counts of proposals, not engineer time or execution eligibility.



The remaining 74.1% has not been proven impossible to automate.

Inside the 25.9% mechanical bucket

1,276 labels to review for exact, repeatable changes

Parameter / metadata	705 | 14.3%
Add / replace file	414 | 8.4%
Dependency version	144 | 2.9%
Shared variant change	13 | 0.3%

All shares use the full 4,922-excerpt denominator.
This bucket includes false positives and missing inputs.

ALREADY SUPPORTED IN A CONTROLLED LOCAL COPY

Real replay: 1 pinned source-file replacement

Fixture replay: 2 parameter edits + 2 shared-file copies

Automatic checks: hashes, exact values, paths, variants and diffs

Other registered edits remain narrow: real actor key or fixture schema.
A general real-ADF parameter / dependency editor is not established.

CURRENTLY NEEDS PEOPLE OR ADDITIONAL CAPABILITY

- Diagnose new bugs and develop / approve fixes
- Choose scientific values and interpret assay / QC results
- Resolve ambiguity; decide release, retain or defer actions
- Perform scientific / physical validation
- Build a real ADF: approved core builder / inputs still missing

Provisional labels include irrelevant or misclassified commentary—for example, Jira fix-version edits tagged as dependency changes.

Sources: weak-action dataset · saved advisory predictions · executor registry · real-source and synthetic-fixture replay manifests. No effort-weighted coverage is available.
